## Hess's Law

State the aim of the experiment.
To confirm Hess's Law.

## Procedure

Use equations to describe the two routes whereby you converted solid potassium hydroxide into potassium chloride solution and label them with appropriate $\Delta \mathrm{H}$ values.

$$
\mathrm{KOH}_{(s)}+\mathrm{HCl}_{\text {(aq) }} \longrightarrow \mathrm{KCl}_{\text {(aq) }}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{c})} \quad \Delta H_{1}
$$

or

$$
\begin{aligned}
\mathrm{KOH}_{(s)}+(\mathrm{aq}) & \longrightarrow \mathrm{KOH}_{(a q)} \\
\mathrm{KOH}_{(a q)}+\mathrm{HCl}_{(a q)} & \longrightarrow \mathrm{KCl}_{(a q)}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}
\end{aligned}
$$

Write down the relationship between the $\Delta \mathrm{H}$ values for Hess's Law to hold true.

$$
\Delta H_{1}=\Delta H_{2 a}+\Delta H_{2 b}
$$

## Results

Present your results in an appropriate manner.

| 1 | Mass of KOH | 1.29 |
| :---: | :---: | :---: |
|  | Temperature of acid | 22.75 |
|  | Temperature of reaction | 38.5 |
| 2 a | Mass of KOH | 1.24 |
|  | Temperature of water | 20.3 |
|  | Temperature of reaction | 25.75 |
| 6 | Temperature of acid | 23 |
|  | Temperature of KOH solution | 24.4 |
|  | Temperature of reaction | 28.75 |

## Calculation/Conclusion

Carry out a calculation to show the confirmation of Hess's Law.

$$
\begin{aligned}
\Delta I_{1} & =15.75^{\circ} \mathrm{C} \\
E & =c m \Delta I \\
& =4.18 \times 0.025 \times 15.75 \\
& =1.65 \mathrm{~kJ}
\end{aligned}
$$

so 56.1 g (1 mole) would give 71.76 kJ

$$
\Delta H_{1}=-71.76 \mathrm{~kJ} \mathrm{~mol}^{1}
$$

$$
\begin{aligned}
& \Delta I_{2 a}=5.45^{\circ} \mathrm{C} \\
& \begin{aligned}
E & =c m \Delta T \\
& =4.18 \times 0.025 \times 5.45 \\
& =0.57 \mathrm{~kJ}
\end{aligned}
\end{aligned}
$$

1.24 g KOH gave 0.57 kJ
so 56.1 g (1 mole) would give 25.77 kJ

$$
\Delta H_{2 a}=-25.77 \mathrm{~kJ} \mathrm{~mol}^{1}
$$

$$
\begin{aligned}
\Delta I_{2 b} & =5.05^{\circ} \mathrm{C} \\
E & =c \mathrm{~m} \Delta I \\
& =4.18 \times 0.05 \times 5.05 \\
& =1.06 \mathrm{~kJ}
\end{aligned}
$$

$$
\Delta H_{1}=-71.76 \mathrm{~kJ} \mathrm{~mol}^{1} \quad \Delta H_{2 a}+\Delta H_{2 b}=-25.77-47.75
$$

The experiment has confirmed Hess's Law with reasonable accuracy.

## Quantitative Electrolysis

State the aim of the experiment.
To confirm the charge of a mole of electrons by determining the quantity of electricity required to produce 1 mole of hydrogen through electrolysing dilute sulphuric acid.

## Procedure

Draw a labelled diagram of the circuit.

List all the measurements that were made during the experiment.

- The volume of hydrogen collected in the measuring cylinder
- The current
- The time

## Results

Present your results in an appropriate manner.

$$
\begin{aligned}
\text { Volume of hydrogen } & =42 \mathrm{ml} \\
\text { Current } & =0.5 \mathrm{~A} \\
\text { Time } & =645 \mathrm{~s}
\end{aligned}
$$

## Calculation/Conclusion

Carry out a calculation to determine the quantity of electricity required to produce one mole of hydrogen. Assume the molar volume of hydrogen to be 24.1 litres $\mathrm{mol}^{-1}$.

$$
\begin{aligned}
Q & =I t \\
& =0.5 \times 645 \\
& =322.5 \mathrm{C}
\end{aligned}
$$

$0.042 l$ were produced by
322.5 C
so 24.11 would be produced by 185053.6C

## Evaluation

In theory, 193000 C are required to produce one mole of hydrogen by electrolysis.
Suggest sources of error which could account for any difference between your result and the theoretical one.

- Inaccurate timing
- Inaccurate measurement of volume
- Current changing throughout experiment
- Hydrogen may dissolve in the water slightly, or be held in the electrode

## A Redox Titration

State the aim of the experiment.
To find the mass of vitamin C in a tablet, using a solution of iodine, and starch as an indicator.

Using the molecular formula for vitamin C write equations for the oxidation and reduction half-reactions and hence write a balanced equation for the redox reaction between vitamin C and iodine.

$$
\begin{array}{rlr}
\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{6} & \longrightarrow \mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{6}+2 \mathrm{H}_{(a q)}^{+}+2 e^{-} & \begin{aligned}
& \text { oxidation } \\
& I_{2(a q)}+2 e^{-} \longrightarrow 2 I_{(a q)} \\
& \mathrm{C}_{6} H_{8} \mathrm{O}_{6}+I_{2(a q)} \longrightarrow \mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{6}+2 H_{(a q)}^{+}+2 I_{(a q)}
\end{aligned} \\
\text { reduction } \\
\text { redox }
\end{array}
$$

## Procedure

Write a brief description of the experimental procedure you carried out to determine the mass of vitamin C in a tablet.

- The vitamin C tablet was dissolved in deionised water and made up to the mark in a standard flask.
- $25 \mathrm{~cm}^{3}$ was pipetted into a conical flask, along with a few drops of starch.
- Iodine solution was run into the flask using a burette, until the blue/black colour just remained.
- The volume of iodine used was noted, and the procedure repeated until concordant results were obtained.

## Results

Record your results in an appropriate manner.

|  | 1st try | 2nd try | 3rd try |
| :--- | :---: | :---: | :---: |
| 1st reading ( ml ) | 0.45 | 12.25 | 23.70 |
| 2nd reading $(\mathrm{ml})$ | 12.25 | 23.70 | 35.25 |
| Titre $(\mathrm{ml})$ | 11.80 | 11.45 | 11.55 |

Average Titre $=11.50 \mathrm{ml}$

## Calculation/Conclusion

Carry out a calculation to determine the mass of vitamin $C$ in the tablet.
$0.025 \mathrm{~mol}^{1}$ means 1000 ml contains $0.025{\text { moles } I_{2}}^{2}$
so
11.5 ml contains $0.025 \times \frac{11.5}{1000}$
$=0.0002875{\text { moles } I_{2}}^{2}$
In the conical flask there were 0.0002875 moles vitamin $C$ so in the 250 ml of vitamin C solution there were 0.002875 moles vitamin C so in 1 tablet there are 0.002875 moles vitamin C

1 mole of vitamin C has mass $\quad 176 \mathrm{~g}$
so
0.002875 moles of vitamin $C$ has mass $176 \times 0.002875$

$$
=0.506 \mathrm{~g}
$$
